Education

- **MES College of Engineering, Kuttippuram** — Kerala, India
  Bachelor of Technology in Computer Science; GPA: 3.72 (8.2/10.0) — *Jun. 2017 – May. 2022*

Experience

- **Discern Security** — Sunnyvale, CA (Remote from India)
  Software Engineer — *Jun 2023 - Present*
  - **Humanrisk Dashboard**: Built the frontend for a comprehensive security risk platform featuring interactive ECharts visualizations (pie, bar, and stacked bar charts) to surface vulnerabilities across endpoints, email, web activity, and user behavior. Developed reusable Vue components for a dynamic dashboard that maps asset vulnerabilities and their impact on overall security posture. On the backend, engineered REST API endpoints with report-code-based data fetching to power real-time risk insights and security analytics.
  - **Asset Management**: Built the frontend for an Asset Management module comprising three core tables — Devices, Applications, and Users — with real-time data aggregation piped from EDR endpoints, ensuring live visibility into asset state and activity across the environment.
  - **Dynamic Dashboard**: Architected a dynamic dashboard framework with a modular, data-source-driven chart builder that streamlines dashboard composition and scales across multiple data pipelines.
  - **Healthcheck User Interface**: Developed a security posture health check interface that analyzes integrated third-party vendor data to map vulnerabilities and generate risk scores. Additionally, implemented evidence-based health checks that leverage AI to generate precise, automated remediation steps for detected security flaws.
  - **React Migration**: Led the migration of the Discern application from Vue/Nuxt 3 to React TypeScript, while overseeing MR reviews and enforcing proper project structure and coding standards throughout the transition.
  - **Notification Center**: Built a real-time notification center for the Discern dashboard that surfaces live threat findings and system anomalies as they occur.
  - **MITRE Attack and MITRE Defend Dashboards**: Developed the MITRE ATTACK and MITRE Defense UIs to visualize and map Health Check-generated scores across vendor products and sub-products, providing a clear view of coverage and gaps in the security framework.
  - **Hierarchical Filters**: Engineered a hierarchical filter system with reusable core filter components, a backend query engine, and tree-structured filtering to handle deeply nested data traversal efficiently.
- **IOCOD Infotech** — Kozhikode, Kerala
  Junior Software Engineer — *Feb 2022 - May 2023*
  - **Merchant Marketplace - Onboarding**: Developed the onboarding user interface using Vue 3, improved the overall flow by integrating accessibility features for all users, and maintained a clean component architecture. A major challenge was creating scalable UI components and establishing base models for colors and styles to ensure easier scaling in the future.
  - **Baccarat**: Was the main lead developer on the Baccarat project — developed scalable UI components and implemented a proper front-end architecture. On the backend, designed and managed Redis Streams to handle real-time game data processing. Also led a team of 3 while building out features including game win tracking, hand logging, and analytical dashboards for player insights.

Projects

- **Powercli**: An open-source, AI-powered CLI assistant for developers, built using Python, Typer, and Rich.
- **Findmyjob**: An application that scrapes the web for job postings based on user prompts and filters. Built using Streamlit for the UI and Ollama for LLM-driven prompt sanitization.
- **OCSF-Toolkit**: An interactive web platform that demonstrates the Open Cybersecurity Schema Framework (OCSF) through four integrated tools: schema visualization, data mapping, event generation, and real-time security monitoring. Built with React, TypeScript, and React Flow, the project showcases OCSF's capabilities in cybersecurity data standardization and analysis.

Programming Skills

- **Languages**: Python, Javascript **Technologies**: AWS, Vue, React, Django DRF, Node, Postgres
